

Troubleshooting & Ticket Guide

Purpose

This document outlines my approach to handling support tickets - from intake to resolution - and how I use tools and communication to keep things efficient.

Initial Assessment

- Read the ticket thoroughly
- Identify if it's urgent (broken feature, blocked user, etc.)
- Check recent logs, updates, and user activity

Tools I Use

- SQL: Query databases to investigate data integrity
- DataDog: Monitor logs and track API/app behavior
- Chrome DevTools: Inspect network calls and console errors
- Existing Documentation & Previous Tickets: To avoid reinventing the wheel

My Workflow

1. Gather relevant data and context
2. Reproduce the issue, if possible
3. Test hypotheses in staging or safely in prod
4. Communicate clearly with the user (no jargon)
5. Document the resolution for the team

Example

Issue: Report not pulling expected results

- Ran SQL queries to confirm missing joins
- Found mismatch in WHERE clause
- Fixed query and explained to client using analogies
- Documented in team wiki for future reference

Tips I Rely On

- If you don't know the answer, ask smart questions
- Keep calm when a user is frustrated - your tone matters

- Always follow up when you say you will
- Leave a breadcrumb trail for the next person

Troubleshooting & Ticket Guide

Final Note

Solving problems is part technical skill, part communication. My goal is always to leave things better than I found them - for users and for the team.
